

Rewrite Systems on Logics: Calculi

	Validity	Satisfiability
Sound	If the calculus derives a proof of validity for the formula, it is valid.	If the calculus derives satisfiability of the formula, it has a model.
Complete	If the formula is valid, a proof of validity is derivable by the calculus.	If the formula has a model, the calculus derives satisfiability.
Strongly Complete	For any validity proof of the formula, there is a derivation in the calculus producing this proof.	For any model of the formula, there is a derivation in the calculus producing this model.

Propositional Logic: Syntax

2.1.1 Definition (Propositional Formula)

The set $\text{PROP}(\Sigma)$ of *propositional formulas* over a signature Σ , is inductively defined by:

$\text{PROP}(\Sigma)$	Comment
\perp	connective \perp denotes “false”
\top	connective \top denotes “true”
P	for any propositional variable $P \in \Sigma$
$(\neg\phi)$	connective \neg denotes “negation”
$(\phi \wedge \psi)$	connective \wedge denotes “conjunction”
$(\phi \vee \psi)$	connective \vee denotes “disjunction”
$(\phi \rightarrow \psi)$	connective \rightarrow denotes “implication”
$(\phi \leftrightarrow \psi)$	connective \leftrightarrow denotes “equivalence”

where $\phi, \psi \in \text{PROP}(\Sigma)$.

Propositional Logic: Semantics

2.2.1 Definition ((Partial) Valuation)

A Σ -*valuation* is a map

$$\mathcal{A} : \Sigma \rightarrow \{0, 1\}.$$

where $\{0, 1\}$ is the set of *truth values*. A *partial* Σ -*valuation* is a map $\mathcal{A}' : \Sigma' \rightarrow \{0, 1\}$ where $\Sigma' \subseteq \Sigma$.

2.2.2 Definition (Semantics)

A Σ -valuation \mathcal{A} is inductively extended from propositional variables to propositional formulas $\phi, \psi \in \text{PROP}(\Sigma)$ by

$$\mathcal{A}(\perp) := 0$$

$$\mathcal{A}(\top) := 1$$

$$\mathcal{A}(\neg\phi) := 1 - \mathcal{A}(\phi)$$

$$\mathcal{A}(\phi \wedge \psi) := \min(\{\mathcal{A}(\phi), \mathcal{A}(\psi)\})$$

$$\mathcal{A}(\phi \vee \psi) := \max(\{\mathcal{A}(\phi), \mathcal{A}(\psi)\})$$

$$\mathcal{A}(\phi \rightarrow \psi) := \max(\{1 - \mathcal{A}(\phi), \mathcal{A}(\psi)\})$$

$$\mathcal{A}(\phi \leftrightarrow \psi) := \text{if } \mathcal{A}(\phi) = \mathcal{A}(\psi) \text{ then } 1 \text{ else } 0$$

If $\mathcal{A}(\phi) = 1$ for some Σ -valuation \mathcal{A} of a formula ϕ then ϕ is *satisfiable* and we write $\mathcal{A} \models \phi$. In this case \mathcal{A} is a *model* of ϕ .

If $\mathcal{A}(\phi) = 1$ for all Σ -valuations \mathcal{A} of a formula ϕ then ϕ is *valid* and we write $\models \phi$.

If there is no Σ -valuation \mathcal{A} for a formula ϕ where $\mathcal{A}(\phi) = 1$ we say ϕ is *unsatisfiable*.

A formula ϕ *entails* ψ , written $\phi \models \psi$, if for all Σ -valuations \mathcal{A} whenever $\mathcal{A} \models \phi$ then $\mathcal{A} \models \psi$.

Propositional Logic: Operations

2.1.2 Definition (Atom, Literal, Clause)

A propositional variable P is called an *atom*. It is also called a *(positive) literal* and its negation $\neg P$ is called a *(negative) literal*.

The functions comp and atom map a literal to its complement, or atom, respectively: if $\text{comp}(\neg P) = P$ and $\text{comp}(P) = \neg P$, $\text{atom}(\neg P) = P$ and $\text{atom}(P) = P$ for all $P \in \Sigma$. Literals are denoted by letters L, K . Two literals P and $\neg P$ are called *complementary*.

A disjunction of literals $L_1 \vee \dots \vee L_n$ is called a *clause*. A clause is identified with the multiset of its literals.

2.1.3 Definition (Position)

A *position* is a word over \mathbb{N} . The set of positions of a formula ϕ is inductively defined by

$$\begin{aligned}\text{pos}(\phi) &:= \{\epsilon\} \text{ if } \phi \in \{\top, \perp\} \text{ or } \phi \in \Sigma \\ \text{pos}(\neg\phi) &:= \{\epsilon\} \cup \{1p \mid p \in \text{pos}(\phi)\} \\ \text{pos}(\phi \circ \psi) &:= \{\epsilon\} \cup \{1p \mid p \in \text{pos}(\phi)\} \cup \{2p \mid p \in \text{pos}(\psi)\}\end{aligned}$$

where $\circ \in \{\wedge, \vee, \rightarrow, \leftrightarrow\}$.

The prefix order \leq on positions is defined by $p \leq q$ if there is some p' such that $pp' = q$. Note that the prefix order is partial, e.g., the positions 12 and 21 are not comparable, they are “parallel”, see below.

The relation $<$ is the strict part of \leq , i.e., $p < q$ if $p \leq q$ but not $q \leq p$.

The relation \parallel denotes incomparable, also called parallel positions, i.e., $p \parallel q$ if neither $p \leq q$, nor $q \leq p$.

A position p is *above* q if $p \leq q$, p is *strictly above* q if $p < q$, and p and q are *parallel* if $p \parallel q$.

The *size* of a formula ϕ is given by the cardinality of $\text{pos}(\phi)$:
 $|\phi| := |\text{pos}(\phi)|$.

The *subformula* of ϕ at position $p \in \text{pos}(\phi)$ is inductively defined by $\phi|_\epsilon := \phi$, $\neg\phi|_{1p} := \phi|_p$, and $(\phi_1 \circ \phi_2)|_{ip} := \phi_i|_p$ where $i \in \{1, 2\}$, $\circ \in \{\wedge, \vee, \rightarrow, \leftrightarrow\}$.

Finally, the *replacement* of a subformula at position $p \in \text{pos}(\phi)$ by a formula ψ is inductively defined by $\phi[\psi]_\epsilon := \psi$, $(\neg\phi)[\psi]_{1p} := \neg\phi[\psi]_p$, and $(\phi_1 \circ \phi_2)[\psi]_{ip} := (\phi_1[\psi]_p \circ \phi_2)$, $(\phi_1 \circ \phi_2)[\psi]_{2p} := (\phi_1 \circ \phi_2[\psi]_p)$, where $\circ \in \{\wedge, \vee, \rightarrow, \leftrightarrow\}$.

2.1.5 Definition (Polarity)

The *polarity* of the subformula $\phi|_p$ of ϕ at position $p \in \text{pos}(\phi)$ is inductively defined by

$$\begin{aligned}\text{pol}(\phi, \epsilon) &:= 1 \\ \text{pol}(\neg\phi, 1p) &:= -\text{pol}(\phi, p) \\ \text{pol}(\phi_1 \circ \phi_2, ip) &:= \text{pol}(\phi_i, p) \quad \text{if } \circ \in \{\wedge, \vee\}, i \in \{1, 2\} \\ \text{pol}(\phi_1 \rightarrow \phi_2, 1p) &:= -\text{pol}(\phi_1, p) \\ \text{pol}(\phi_1 \rightarrow \phi_2, 2p) &:= \text{pol}(\phi_2, p) \\ \text{pol}(\phi_1 \leftrightarrow \phi_2, ip) &:= 0 \quad \text{if } i \in \{1, 2\}\end{aligned}$$

Valuations can be nicely represented by sets or sequences of literals that do not contain complementary literals nor duplicates.

If \mathcal{A} is a (partial) valuation of domain Σ then it can be represented by the set

$$\{P \mid P \in \Sigma \text{ and } \mathcal{A}(P) = 1\} \cup \{\neg P \mid P \in \Sigma \text{ and } \mathcal{A}(P) = 0\}.$$

Another, equivalent representation are *Herbrand* interpretations that are sets of positive literals, where all atoms not contained in an Herbrand interpretation are false. If \mathcal{A} is a total valuation of domain Σ then it corresponds to the Herbrand interpretation $\{P \mid P \in \Sigma \text{ and } \mathcal{A}(P) = 1\}$.

2.2.4 Theorem (Deduction Theorem)

$$\phi \models \psi \text{ iff } \models \phi \rightarrow \psi$$

2.2.6 Lemma (Formula Replacement)

Let ϕ be a propositional formula containing a subformula ψ at position p , i.e., $\phi|_p = \psi$. Furthermore, assume $\models \psi \leftrightarrow \chi$. Then $\models \phi \leftrightarrow \phi[\chi]_p$.
